

An applicant who wants to apply for housing support finds a staff member in the office or goes to a frontline worker. Then the staff or the worker uses the computer tool to decide.

The computer first finds out the application's public service records and uses those records to decide the likelihood of the applicant experiencing three different situations in the future. The three situations are: emergency room visits, mental health inpatient, and jail booking.

The computer generates a risk score between 1 and 10 based on the likelihood of the applicant experiencing the three kinds of situations. The higher the score, the more likely the applicant could get housing assistance.
